## Econometrics

### What is Econometrics?

- Econometrics may be defined as the quantitative analysis of actual economic phenomena (A. H. Studenmund: *Using econometrics*. 2<sup>nd</sup>. 1992.).
- Econometrics has three major uses:
  - i. the description of economic reality,
  - ii. the testing of hypotheses about economic theory,
  - iii. the forecasting of future economic activity.

# 1. Definition

- If X and Y are random variables than their **correlation** is

$$R = \frac{Cov(X, Y)}{\sqrt{Var(X)}\sqrt{Var(Y)}} = \frac{\sum(X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum(X_i - \bar{X})^2} \sqrt{\sum(Y_i - \bar{Y})^2}}$$

- As with the covariance, the correlation R between two random variables measures the degree of **linear** association them.

(R. Carter Hill, William E. Griffith, George G. Judge: Undergraduate Econometrics, 2001. 2ed.)

- The correlation must lie between -1 and +1.
- Thus, the correlation between X and Y is nearly +1 or -1, if X is a perfect positive or negative linear function of Y. If  $Cov(X, Y) = 0$  then  $R = 0$ , X and Y can shout be not correlation linear.

## 2. The level of correlation

- If  $R$  *more than* 0.6, then X and Y is strength correlation.
- If  $0.2 \leq R \leq 0.6$ , then X and Y is good correlation.
- If  $R$  less than 0.2, then X and Y is low correlation.

In practice case, this coefficient is rarely very nearly one of this tree closed boxes.

# Compare the value of the coefficient correlation

### 3. Representation type of correlation

#### Positive linear correlation

**GRAPHIQUE 3**  
Corrélation linéaire positive.

**GRAPHIQUE 6**  
Corrélation non linéaire positive.

### 3. Representation type of correlation (cont.)

#### Negative linear correlation

### 3. Representation type of correlation (cont.)

Non correlation between X and Y

**GRAPHIQUE 5**  
**Corrélation linéaire nulle.**

## 4. Numeric application

Example. True or fail, consumer  
Used their income for cigarettes  
for a long time since 1934 until  
1950 deaths by lung cancer.  
Presentation by scatter graph and  
Calculate a R coefficient correlation.

| No | Country       | Cigarette consumption | Deaths per million |
|----|---------------|-----------------------|--------------------|
| 1  | Australia     | 480                   | 180                |
| 2  | Canada        | 500                   | 150                |
| 3  | Denmark       | 380                   | 170                |
| 4  | Finland       | 1100                  | 350                |
| 5  | Great Britain | 1100                  | 460                |
| 6  | Iceland       | 230                   | 60                 |
| 7  | Netherlands   | 490                   | 240                |
| 8  | Norway        | 250                   | 90                 |
| 9  | Sweden        | 300                   | 110                |
| 10 | Switzerland   | 510                   | 250                |
| 11 | U.S.          | 1300                  | 200                |

## 4. Numeric application(cont.)

The correlation scatter by graph, be low

## 4. Numeric application(cont.)

|       | 300                          | 110                       | -303.6363         | -95.4545          | 28983.451                        | 92195               | 9111.562            |
|       | 510                          | 250                       | -93.6363          | 44.5455           | -4171.0758                       | 8767.757            | 1984.302            |
|       | 1300                         | 200                       | 696.3637          | -5.4545           | -3798.3158                       | 484922.4            | 29.75157            |
| mean= | 603.6363636                  | 205.4545455               |                   |                   |                                  |                     |                     |
|       |                              | Somme<br>total=           | 0.0007            | 0.0005            | 327181.82                        | 1432255             | 137472.7            |

## 4. Numeric application(cont.)

Using formula,

$$R = \frac{Cov(X, Y)}{\sqrt{Var(X)}\sqrt{Var(Y)}} = \frac{327181.82}{\sqrt{1432255} \sqrt{137472.7}} = 0.7373451$$

The R coefficient value  $R = 0.7373451$

The conclude that a deaths lung cancer by consumption cigarettes for long time since 1934 until 1954 is a correlation linear positive.

Whit is a level of confidence for this R coefficient correlation?

## 5. Test confident level of R coefficient correlation

- The coefficient correlation R is estimated by formula  $R = \frac{Cov(X,Y)}{\sqrt{Var(X)}\sqrt{Var(Y)}}$
- According theory of test, permitted to test statistic determined
  - i. Null hypothesis  $H_0 : R = 0$
  - ii. Alternative hypothesis  $H_1: R \neq 0$
- Student score at degree of freedom n-2, we calculated t-statistic, it called t-student score

$$t^* = \frac{|R|}{\sqrt{\frac{1-R^2}{n-2}}} \quad (\text{Régis Bourbonnais: Économétrie, 2015. 9th ed})$$

- If  $t^* > t_{n-2}^{\alpha\%/2}$  : reject  $H_0$ , R is significant statistic at risk  $\alpha$  % .

## 5. Test confident level of R coefficient correlation (cont.)

- For our example precedence,
- Define hypothesis:  $H_0: R = 0$ , and  $H_1: R \neq 0$
- We calculate the R coefficient correlation, using formula

$$t^* = \frac{|R|}{\sqrt{\frac{1-R^2}{n-2}}} = \frac{|0.7373451|}{\sqrt{\frac{1-0.7373451^2}{11-2}}} = 3.274585$$

- Use right-tail table critical values for the t-distribution
- $t^* = 3.274585 > t_{11-2}^{5\%/2} = 2.262$  reject  $H_0$ , R coefficient correlation is significant at risk 5% and different zero. Thus, the deaths lung cancer by using cigarettes for a long time is correlated in confident level at risk 5%.

## Example: presentation data by curve and calculate R coefficient correlation

Total Consumption and Gross Income for household In France(in million EURO),
